

Saadiumm Data pad

The Saadiumm data pad is a small hand-held device used to read information. There are data cards to transfer information from pad to pad. There is a port for an optional external hard drive.

The computer generated touch pad is used when there are more keys used than there are available on the main keyboard. The scroll up & down buttons scroll up and down the page but do not go onto the next page when the bottom is reached. The previous & next page buttons skip to the previous or next page but do not scroll up or down. The power button turns the pad on or off. The eject button ejects the data card (in there is one in the slot). Virus scan checks the pad's internal soft drive for virus'. If a virus is found, one can hit the "Disk repair" button and the virus will be eliminated in most cases.
